## Overview

My research focuses on machine learning with particular emphasis on neural networks. Over the past 5 years, I have developed expertise in deep learning, contributing 15 publications to leading journals and conferences. My work addresses fundamental questions about model interpretability, with applications in healthcare and autonomous systems.

The central theme unifying my research is developing trustworthy AI systems. This work has been supported by NSF and NIH grants and has led to collaborations with researchers at MIT and Stanford.

## Research Background and Motivation

The field of artificial intelligence has seen remarkable advances in recent years. My research is motivated by the observation that current AI systems lack transparency and explainability.

## Past Research

My doctoral dissertation examined interpretable machine learning methods. The key contribution was developing a novel approach to neural network visualization that improved model understanding by 40%.

## Current Research

My current research program consists of three interconnected projects investigating robust AI, fair machine learning, and explainable AI systems.

## Future Research Directions

Looking ahead 3-5 years, I plan to pursue research in trustworthy AI, focusing on safety, fairness, and interpretability.

## Conclusion

My research program addresses fundamental questions in AI while maintaining strong connections to real-world applications in healthcare and autonomous systems.
